**Information on change of solvent used for
"Solvent vapor adsorption performance"**

Dear Customers,

In the past, Environmental Solutions Division had used "benzene" as a solvent to measure the adsorption performance of solvent vapor.

But for our employee health, we have been studying to change "benzene" to "toluene", which exhibits similar behavior for solvent vapor adsorption.

This examination took a lot of time, but now that we have established the analysis method, we would like to inform you that we will make a change from "benzene" to "toluene".

We appreciate your understanding in order to improve the occupational safety environment.

Best Regards,
